It was shown that an elongated circular cylinder is in neutral equilibrium with respect to small expansions or contractions on the cylinder surface if the expanse of the expansion or contraction in the direction of the axis of the cylinder is greater than the radius of the cylinder, but is stable if the longitudinal expansion of the disturbances is smaller than the cylinder radius. The conception of a thermodynamic equilibrium existing in every plasticized material between solvated and unsolvated plasticizer molecules arose out of previous measurements on plasticized materials. The equilibrium depends on the nature of the high polymeric substance and the plasticizer, on the concentration of the plasticizer, and the temperature. The unsolvated plasticizer molecules are the ones that diffuse, and
